

Choosing Activation Functions

Output Layer

Choosing $g(z)$ for output layer?

If Binary classification,
 $\Rightarrow$ sigmoid function
since, $y = 0$ or 1

If Regression with expected
 $y = +ve$ or $-ve$ values
Linear Activation function.

If Regression with expected
 $y \geq 0$ values
ReLU

Hidden Layer

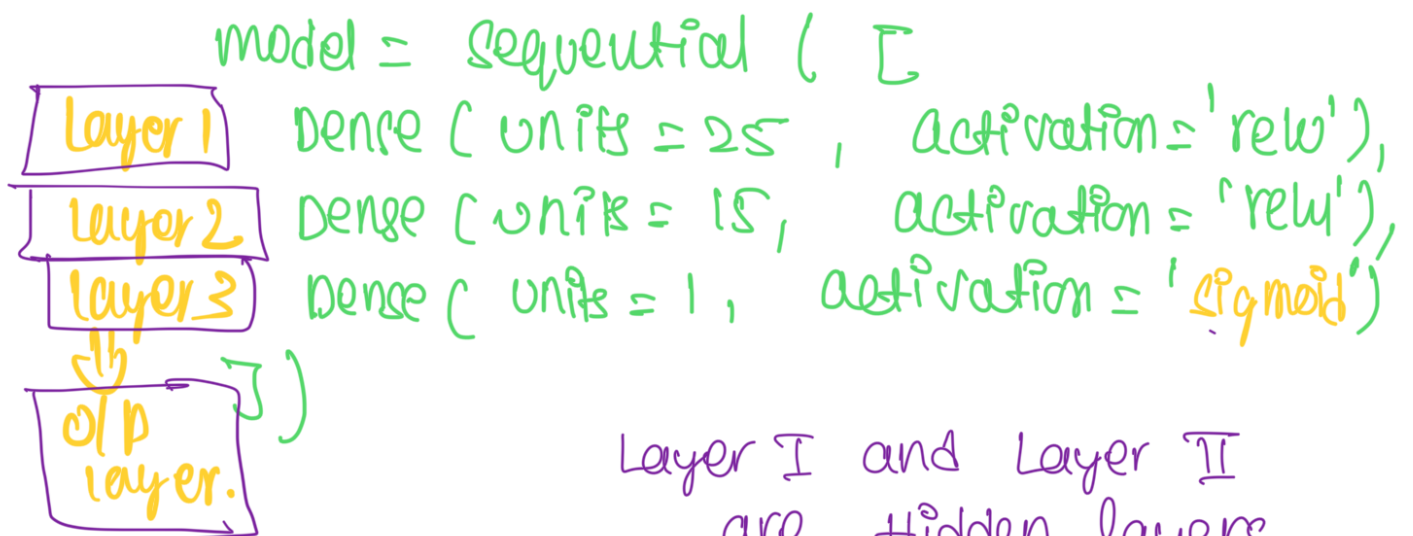

Choosing $g(z)$ for hidden layer?

There are two most used activation functions.

ReLU and Sigmoid function

Most common choice
since, faster in code
and faster Learning rate.

⇓
since it has only one
flat, causing gradient
descent to converge faster.

Layer I and Layer II
are hidden layers
and
Layer III is output
layer.

Hence, we use
ReLU, by default for hidden
layers
and

~~~~~

for output layer we can choose based on our needs. (or, expected outputs).
